Thermo-groove™ six-seal system

The six seal system enhances the thermal performance and significantly improves the sealing capabilities of the joint between the logs.

- Comparing the log joint to the thermal pane window, if the 6 seals represent the six sheets of glass the dead air space between the panels is the insulation therefore the dead air space between each seal also improves the insulation capabilities.
- Having 6 individual seals also provides a thermal break. This is far superior than having one wide seal.
- The butyl tape has been tipped up on an angle. This improves installation, as the butyl tape is less likely to fall off while setting the log above. Utilizing the diagonal, the square butyl tape changes the seal from a 1/4" seal to a 3/8" seal. This is significant as we are gaining performance without increasing the cost to go to a 3/8" seal.
